

Agent Swarm: A Synthetic Study of Parallel Work

Synthetic Glyph demonstration — not a real paper or investment analysis.

ABSTRACT

The system decomposes a complex request into independent work packets.

ABSTRACT

Four workers execute packets concurrently before a verified merge.

SYNTHETIC MEASUREMENT

Sequential delay is 90 synthetic ms; parallel delay is 20 synthetic ms.

2. Mechanism and Failure Behavior

Synthetic Glyph demonstration — not a real paper or investment analysis.

MECHANISM

Each worker reads a shared cache but writes only to its assigned partition.

FAILURE BEHAVIOR

Failed packets are retried once, then surfaced without a plausible fallback.

SCOPE

Parallel execution changes scheduling in this demo, not model weights.

3. Limitations and Baseline

Synthetic Glyph demonstration — not a real paper or investment analysis.

LIMITATIONS

This synthetic study does not measure production cost or market demand.

LIMITATIONS

No company, security, or trade is evaluated in this demonstration.

BASELINE

A sequential baseline completes nine synthetic steps before aggregation.
